Expression and signed deletion attribution in the same cells

PBMC coarse · 100 supports/class · 191 / 320 queries explained

Development cortex · 10 supports/class · 96 / 7,769 queries explained

All query cells are retained. Gray attribution backgrounds mark cells without explanations; outlined points mark explained cells.
Color limits span observed values (symmetric around zero for attribution), independently per gene. RNA geometry is fixed within a case.
Positive attribution supports the predicted class over its fixed runner-up; expression direction and causality are not inferred.
